Surveys

ABSTRACT

This national survey of school psychologists was undertaken to provide comprehensive data regarding this professional speciality including such areas as background and training certification requirements, professional affiliation, professional needs and problems, part-time activities, salary and contractual arrangements, psychologist-student services ratios, private practice and future development of the profession. Findings suggest that the role and function of school psychologists appear to be dominated by routine activities of individual diagnosis, report writing and conferences. Critical skills considered to be in need of further development include improved psychological and educational diagnosis, educational programming, behavior modification planning, counseling and professional communication. Definitive clarification regarding current and future role and function, licensing, and certification were the prominent needs and concerns identified by the respondents. The public image of the school psychologists was als e. sized as a matter of national professional concern. Finally, the pears to be a manpower shortage of school psychologists nationally as well as the limited involvement of school psychologists in federally funded projects. (Author/RK)

ACKNOWLEDGMENTS

The authors wish to acknowledge the leadership of The National Association of School Psychologists, its Executive and Research Committees, the assistance of The Ohio School Psychologists Association, and the support of The University of Akron in the inception and completion of this study.

Grateful appreciation is also extended to all of those who participated in this survey with particular appreciation to those who made special contributions of time and effort from the very beginning and throughout the duration of the project.

Special recognition is accorded to Mr. Thomas Wrenn, school psychologist, who labored conscientiously in the preparation of tables and statistical summaries.

SUMMARY - ABSTRACT

The national survey of school psychologists was undertaken to provide comprehensive data regarding this professional specialty including such areas as background and training, certification requirements, professional affiliation, professional practice, role and function, involvement in federal programs, professional needs and problems, part-time activities, salary and contractual arrangements, psychologist-student service ratios, private practice and future development of the profession.

The results of the study were analyzed on a national basis, by regions of the country, and for eighteen selected states. Cross tabulations of various stratifications provided sub-group comparisons.

A questionnaire was completed and returned by 3,138 school psychologists from throughout the country, 79 percent of whom were primarily employed by school systems. The information collected revealed much similarity in training, work experience, professional practice, parttime activity, and professional concerns and needs.

The role and function of school psychologists appeared to be dominated by routine activities of individual diagnosis, report writing and conferences. Critical skills considered to be in need of further development included improved psychological and educational diagnosis, educational programming, behavior modification planning, counseling and professional communication.

Definitive clarification regarding current and future role and function, licensing, and certification were the prominent needs and concerns identified by the respondents. The public image of the school psychologist was also emphasized as a matter of national professional concern.

The relatively high psychologist-student service ratios suggested a critical manpower shortage in school psychology of national scope.

The extent to which school psychologists were involved in federally funded programs suggested that the profession has not been a major participant in federally supported projects. The role of those school psychologists involved in federal programs was largely limited to that of evaluator.

Recommendations of the study included:

1. That a comprehensive program of in-service workshop training for school psychologists be planned by the profession and implemented by federal and state governments through such a vehicle as the Educational Professional Development Act, in order to provide further development of the critical skills identified in the survey.

ERIC

viii

- 2. That a national effort by professional school psychologists be made to examine and clarify the current and future role and function of the school psychologist in terms of anticipated educational and mental health needs of students.
- 3. That a national program for manpower recruitment and training be designed by the profession and supported by federal funding to reduce the apparent professional shortages in school psychology as revealed in the high psychologist-student service ratios
- 4. That a national program of inter-state reciprocity regarding licensing and certification of school psychologists be formulated by national professional groups in conjunction with state departments of education.
- 5. That national training and accreditation standards and guidelines be developed to provide for the most efficient and effective production and practice of school psychologists.

CHAPTER I PROBLEM AND OBJECTIVES

The history of school psychology has been one of isolated islands of development around the country with virtually no intercommunication. Statewide professional groups have been formed to develop school psychology but have been variously limited by a dearth of adequate professional resources, lack of national support and leadership, and by the existence of locally restrictive approaches and attitudes regarding school psychological services. Over the years questions have evolved out of each isolated area pertaining to the role and function of the school psychologist, the nature and extent of training, and the potential of the profession. Local and state groups have reflected concern about difficult problems locally and have revealed anxiety about how school psychology will meet the expanding educational and mental health needs of school children.

While there has been a rapid increase in the number of school psychologists working in the field, lack of adequate communication and information has had serious ramifications. Proceedings of the Bethesda Conference on Problems and Issues in School Psychology (1964), indicated that:

"....it has been difficult for governmental and other agencies in a position to support training in mental health programs to know what to expect of school psychology since, from their perspective, no firm trends have been discernible".

It is very possible that trends are developing in school psychology but lack of adequate communication has kept them blurred.

Establishment in St. Louis on March 14, 1969, of the National Association of School Psychologists (NASP) provided a vehicle for communication among practicing school psychologists. Representatives from all geographical areas of the United States, meeting in St. Louis, agreed that the first major activity of the new organization should be to undertake a major status study of school psychology. Accordingly, they made available to Doctors William Farling, Advisor to School Psychologists, and Wenneth C. Hoedt, Coordinator of Research, College of Education, The University of Akron, their mailing list of approximately six thousand names.

This was the largest up-to-date list of active school psychologists ever compiled representing practitioners from all parts of the country.

The purpose of the status study of school psychology was to make a comprehensive status survey of school psychologists in the United States to determine trends with respect to:

- 1. Role and functions
- 2. Areas of responsibility
- 3. Direction school psychology should be going
- 4. Training
- 5. Contract and remuneration policies
- 6. Involvement in Federal Programs
- 7. Certification

The need to evaluate the role of the school psychologist, the areas of responsibility assigned to school psychologists and the direction of school psychology for the future, were major issues at the Thayer Conference of 1954 (Cutt, 1955) and of the Bethesda Conference of 1964 (Bardon, 1965). At neither conference was there available a concise statement of what school psychologists in the field were doing, what should be expected of them or what basic needs existed in the profession at local levels.

Conclusions and recommendations of the Bethesda Conference, published by Jack I. Bardon, President-Elect of Division 16, APA, included,

"It is recommended that encouragement be given to the study of school psychology based on the collection of relevant fact about this developing professional specialty. State departments of education and school psychologists in the field should also become involved in self-study with emphasis on role, changes in role and characteristics of school psychologists under differing working conditions." (Bardon, 1965).

As of the Spring of 1969, a national unbiased collection of these relevant facts had not been made. Inglis (1959) surveyed administrators, teachers and school psychologists in Sacramento County, California; Gross and Bonham (1966) investigated national entry requirements into school psychology; Styles (1965) surveyed teachers in twenty-eight Southwest Ohio schools on the perception of the school psychologists role; the California Association of School Psychologists and Psychometrists surveys its members each year, (Unpublished); the Ohio Division of Special Education, The Ohio School Psychologists Association and the Department of Psychology, Xavier University (1967) sent a comprehensive questionnaire to Ohio School Psychologists; Dunn (1964) surveyed all Michigan school systems of over five thousand pupils to determine the extent of employment of School Diagnosticians; Flax and Anderson, (1966) sent questionnaires to all school psychologists in Colorado. These and similar surveys all suffered from a narrowness of scope in terms of the areas investigated and/or the populations sampled.

This deficiency is understandable considering that neither a large comprehensive mailing list of school psychologists nor adequate funds had been available to initiate a large comprehensive survey.

Review of all available information pertaining to professional school psychology made it apparent that there was a pressing need for a comprehensive material status study of this occupational specialty.

CHAPTER II METHODS AND PROCEDURES

Initial activities of the National Survey of School Psychologists in the Fall of 1969, involved augmenting the available list of approximately six thousand school psychologists by contacting state departments of equation and other professional personnel. The mailing list of Division 16 of APA was also secured. Names from these lists were cross-checked with the NASP list already available to the researchers in order that duplication of mailings would be avoided. The final mailing list included 9,223 names, as compared to approximately 6,000 names when the study was initiated.

A tentative survey instrument covering demographic data, role and function, training, areas of mesponsibility, certification, contract policy and the future direction of school psychology was developed.

During the Winter of 1909, a pilot study was conducted to verify the clarity and precision of the questions. Participants in the pilot study included 35 school psychologists meeting at a NASP executive session in Chicago. The background of the participants encompassed persons assigned to public schools, state departments of education, and universities. Formal education of the pilot participants included psychologists with Doctoral, Master, and Bachelor Degrees. Prior to administering the survey to the pilot group, it had been reviewed by members of the NASP Research Committee.

Written and verbal comments by the pilot group resulted in the survey being revised. A second pilot study was conducted using as participants thirteen school psychologists from the Akron area of Ohio. Again, comments were solicited and the questionnaire was revised a third time, and a third pilot study was conducted on a population of eight school psychologists.

The staff of the University of Akron Computer Center reviewed the questionnaire for data recording problems; adjustments were made as required.

A final draft of the questionnaire was prepared and processed through the Department of Health, Education and Welfare Regional Office, Region V.

Prior to mailing the survey, letters were sent to 144 directors of school psychology programs in state departments of education, officers of state and national organizations, and university trainers of school psychologists describing the survey to be conducted and requesting their help in promoting a large return. (See Appendix A)

The survey, with an introductory letter and return envelope, was mailed in February, 1970. (Appendix B) Two weeks after the initial mailing, a second letter was sent to state department of education personnel, officers of state and national organizations, and to university trainers again requesting their help in obtaining a large return. Several days after these letters were mailed, a follow-up card was sent to expsychologist on the master mailing list, requesting a prompt return of the survey. (Appendix C) Additional questionnaires were mailed when a survey was returned because of an improper address and when a corrected address was available.

The total N of the mailing was 9432 questionaires of which 850 were returned because of improper addresses. Completed questionnaires were received from 3138 psychologists hence the data to be reported reflects the responses of approximately 33 percent of the total population to whom the survey was mailed; the percent of completed returns, after subtracting those surveys not delivered from the total mailed, was 37 percent.

Each questionnaire returned was coded and inspected to assure that questions had been properly completed. Questions that were incorrectly completed were deleted from the final tabulation. Eighty-seven percent of the surveys returned were found to be free of error. All inspected questionnaires were sent to the data processing laboratory for key punching of coded responses on IBM cards. Written comments on the questionnaires were tabulated by a project assistant.

A computer program was written to run cross tabulations on the following specific variables of the National Survey of School Psychologists in addition to a general tabulation:

- 1. Professional Memberships (APA, NASP, State School Psychologists, State APA)
- 2. Non-school APA members
- 3. Psychologists with an elementary school background
- 4. Psychologists with a secondary school background
- 5. Educational background: Bachelor's Degree, Master's Degree, Master's Degree + 30 semester hours, Specialist's Degree, and Doctoral Degree
- 6. Pupil enrollment in the school district being served, under 3000, 3000 7999, 8000, 12999, 13000 17999, 18000 22999, 23000 27999, 28000 32999, 33000 37999, 38000 57999, 58000, 97999, 98000 157,999, 158,000 +
- 7. Political location of school psychologists employer, city, town or village, county, combined district

Data were made available in terms of both the number and percent of persons answering each question.

Cross tabulations on all data according to the following geographical regions were also run:

| NORTHEASTERN | SOUTHERN | MIDWESTERN | WESTERN |
|-------------------|----------------|--------------|------------|
| Pennsylvania | Oklahoma | Ohio | Washington |
| Maryland | Texas | Missouri | California |
| New York | Arkansas | Indiana | Idaho |
| New Jersey | Louisiana | Michigan | Utah |
| Delaware | Mississippi | Illinois | Arizona |
| Connecticut | Tennessee | Wisconsin | Montana |
| Rhode Island | Alabama | Iowa | Wyoming |
| Massachusetts | Kentucky | Kansas | Nevada |
| New Hampshire | Georgia | Minnesota | Colorado |
| Vermont | Florida | Nebraska | New Mexico |
| Maine | West Virginia | Nebraska | Oregon |
| Washington, D. C. | Virginia | North Dakota | Hawaii |
| | North Carolina | South Dakota | Alaska |
| · | South Carolina | Canada | |

A decision was also made to run separate tabulations for each state from which fifty or more questionnaires were returned. The following are the states which fell into this category:

| New York | Wisconsin |
|-------------|--------------|
| Maryland | Iowa |
| New Jersey | Kansas |
| Connecticut | Minnesota |
| Ohio | Florida |
| Missouri | Washington |
| Indiana | California |
| Michigan | Arizona |
| Illinois | Pennsylvania |

Regional analyses were made in order to determine trends in school psychology in various parts of the country. State breakdowns were provided for the use of individual State Departments of Education and State School Psychologists Associations. The numerical returns for each state and region are provided in Appendix D.

CHAPTER III NATIONAL DATA ANALYSIS

The responses of the 3,138 participants in the national survey of school psychologists are reported below. At a are reported according to stratifications based upon the respondents! (1) organizational memberships, (2) primary employment, (3) highest degree earned, (4) teaching experience, (5) school system enrollments and (6) the political location of school systems. In addition, the total unstratified responses are reported. The number of respondents reporting in the respective categories are presented for each stratification. Reactions of the total population and the stratified sub-populations to each question are reported in terms of percentages.

Interpretation of the data presented below should take into account that for some questions the combined percentages will be greater than 100 because respondents were able to react to more than one part of a question. Total percentages below 100 resulted from questionnaire returns on which selected questions were answered, while others were left blank.

Data in Table 1 includes the total and stratified population responses to the three inquiries presented below.

Circle one number at the right that corresponds to whether you are primarily (1) self employed; (2) work for a school system; (3) work for a state department of education; (4) work for a mental health institute, clinic, hospital, etc.; (5) teach at a college or university.

Circle the number at the right indicating your sex: (1) Males; (2) Female

| Indicate | your | present | age | (|
|----------|------|---------|-----|---|
|----------|------|---------|-----|---|

Inspection of this data will show that with the exception of one sub-population (non-school APA members) a majority of the returns were from psychologists whose primary work responsibility was to a school system. The second most often reported center of employment for respondents was the university or college setting. The reader's attention is directed to the column heading, Primary Employment; review of the number of people in each sub-population of this category will show that, of the total 3, 138 respondents, 2,464 considered a school system their primary employer.

Because of retrival problems data related to questions 13, 14, 15, and 17 are not reported in Chapter III.

A division of the respondents according to sex showed that 59 percent of the returns were from men. A majority of respondents from all organizations were male. This trend was most apparent among APA and State APA returns. The split in returns from males and females was closest in NASP where 52 percent were from men and 47 percent were from women. The data suggests a slight trend for men to seek more formal preparation beyond the Master's Degree than women.

Few marked differences in age were noted among the various sub-populations. A majority of the total group responding reported being between 35 and 49 years of age. College teachers were the oldest group with only ten percent 34 years of age or younger. Among the sub-populations, there was no clear indication of one group having a different average age from the others.

Data from the statement requesting respondents to

circle the numbers at the right corresponding to the organization memberships you presently have: (1) APA (Member or Associate); (2) State APA Association; (3) NASP; (4) CEC; (5) APGA; (6) State Sch. Psy Assn.

are reported in Table 2 and indicate the organizational membership patterns of the total and stratified populations. Upon inspection of this Table, it becomes immediately evident that large numbers of psychologists have multiple memberships in organizations whose principal concerns are about school age children. One-third of the NASP members responding also reported being on the membership roles of APA; while about one-fourth of the APA members reporting indicated having membership in NASP. A significant percentage of both APA and NASP members belonged to state school psychologists associations; 64 and 74 percent, respectively.

The total number of primarily self-employed psychologists was 71, of whom 76 percent were members of APA. Only 16 percent of this sub-population reported having a membership in NASP. A membership in APA or a State APA association appeared most often if the respondent was self-employed, employed by a mental health institute, or if he taught at a college. When the primary employer was a school system or a state department of education, the respondents reported more memberships in state school psychologists associations than in any of the other organizations. Almost one-third of the 2,464 psychologists whose primary employers were school systems held memberships in NASP. This was the highest percentage of NASP members in any employer sub-population.

School psychologists in educational systems of all sizes were more apt to join a state school psychologists association than any other organization. A higher percentage of school psychologists in very large city school systems belonged to APA than did psychologists from smaller systems.

* Data reported in percentages. ** Determined through cross tabulation of data between questions six and eight of the survey (see Appendix B).

Data obtained from the following questions are reported in Table 2 or discussed in the paragraphs below.

Circle at the right the one number corresponding to the highest degree you have earned. (1) Bachelor's; (2) Master's; (3) Specialist's; (4) Doctorate.

SKIP QUESTION BELOW IF YOU HAVE A MASTER'S DEGREE OR HIGHER

Circle at the right the number of the correct answer:

- (a) Are you working toward a Master's Degree? (1) Yes; (2) No
- (b) Do you plan to obtain a Master's Degree? (1) Yes; (2) No; (3) Undecided

SKIP QUESTION BELOW IF YOU HAVE A DEGREE ABOVE THE MASTER'S LEVEL

- (a) Are you working toward a Specialist's Degree? (1) Yes;(2) No
- (b) Do you plan to work toward a Specialist's Degree?(1) Yes; (2) No; (3) Undecided
- (c) Are you working toward a Doctorate Degree? (1) Yes; (2) No
- (d) Do you plan to work toward a Doctorate Degree?
 - (1) Yes; (2) No; (3) Undecided

As accurately as you can and in the space provided, record the exact number of hours of graduate work you have taken beyond your Master's Degree in each of the following university departments.

| Semester Hours: | EducationPsychology | SociologyOther |
|-----------------|---------------------|----------------|
| Quarter Hours: | Education | Sociology |
| | Psychology | Other |

These questions were concerned with past, current, and future involvements of the respondents to prepare themselves at various professional levels.

Inspection of Table 2 will show that 62 percent or more of the responding membership of the four organizations (across which the data were stratified) reported having at least a Master's Degree plus thirty additional semester hours. APA members had the highest percentage of psychologists with a Doctoral Degree although the percentage of psychologists with Doctoral Degrees in any single sub-population was quite small. This reflects the relatively small number of Doctorates on the mailing list.

A Bachelor's Degree was generally rejected as sufficient training for entry into school psychology, as indicated by the fact that only one percent of the total population reported their highest earned degree at that level. Approximately the same percentage indicated they were working toward, and planned to earn, a Master's Degree.

Four percent of the total population indicated they were working toward a Specialist's Degree, three percent planned to obtain such a degree, and thirteen percent were undecided. Generally, there were no important differences among the sub-populations with respect to the percent of psychologists working, or planning to work, toward a Specialist's Degree.

Fifteen percent of the psychologists who returned questionnaires indicated that they were working toward a Doctor's Degree, 12 percent planned to work toward such a degree and 18 percent were undecided. Among non-terminal degree holders in APA, NASP, State School Psychologists, and State APA associations, the respective percentages working toward a Doctoral Degree were 14, 15, 15, and 13; the percent of respondents planning to obtain a Ph.D. in each category was 7 in APA, 14 in NASP, 11 in state associations, and 8 in State APA associations; the percentages for those undecided about the Doctorate ran 10, 24, 19 and 12, for the four respective organizations. A slight trend may be noted for NASP members to be more positively oriented toward the terminal degree. Most respondents, however, expressed no interest in obtaining the doctorate.

Table 3 provides percentage data regarding major academic fields for earned degrees.

Psychologists' responses to the questions:

During the past year have you elected a course for credit at a college or university? (1) Yes; (2) No During the past two years have you attended a continuing (three or more related meetings) organized professional development program in which you were not a speaker? (1) Yes (2) No.

reflect a continuing interest in becoming more effective practitioners (Table 4). While the data reported above does not indicate a strong trend toward obtaining a Doctoral Degree, there was much evidence that psychologists responding to the questionnaire were continuing their training in formally organized situations. It is to be particularly noted that, with the exception of non-school APA members, 66 percent, or more, of the respondents in the sub-populations had attended a continuing professional development program during the two years prior to receiving the survey questionnaire.

* Data reported in percentages.

The extent to which various referral agencies were used by members of the sub-populations is reported in Table 5. Data in this Table were collected when responses to the following request were tabulated:

Circle at the right the numbers that correspond to services you have made referrals to during the past year.

- (1) Family Services; (2) Juvenile Court; (3) Agency for unwed mothers; (4) Diagnostic Clinic; (5) Reading Clinic;
- (6) Welfare Board; (7) Private Psychologist; (8) Private Psychiatrist; (9) Detention Home; (10) Tutorial Service;
- (11) Dentist; (12) M. D. General; (13) M. D. Neurologist;
- (14) Institutionalization; (15) M. D. Eye-Ear

Inspection of Table 5 will show that all sub-populations took extensive advantage of referral mossibilities. Among the more widely used referrals were Family Services, Diagnostic Clinics, M. D. (general), and M. D. (neurologist). Referrals to Dentists, Detention Homes, and Agencies for unwed mothers were seldom used. Psychologists with Doctoral degrees were less apt to make referrals than were psychologists at lower degree levels. Across organizational sub-groups, the only important difference in the percent of psychologists who made referrals to a particular service was that fewer members of APA and State APA groups made referrals to general medical practitioners. It may also be noted that generally fewer non-school APA members made referrals than other stratified populations evaluated.

Data in Table 6 contain the school certification pattern of psychologists responding to the request to:

Circle at the right the numbers that correspond to areas in which you are or have been certified or licenses to work in a school.

- (1) Elem. Teach.; (2) Sec. Teach.; (3) Counselor; (4) Admin.;
- (5) Visiting Teach.; (6) Sch. Psych.; (7) Speech Therapist;
- (8) No certification or license (past or present) in above areas.

Inspection of Table 6 will show that the respondents were generally school oriented at one juncture in their careers and that multiple certification in specific educational fields, in addition to being certified as a school psychologist, was not uncommon. The most frequently held certification, other than school psychologist, was in the areas of secondary teaching. The high percentage of nonschool APA members who have or had been certified to practice in a school system is noteworthy.

Responses to the request to:

Circle at the right the one number corresponding to the minimal degree requirement you feel should be required of school psychologists working full time for a school system. (1) Bachelor's; (2) Master's; (3) Specialist's; (4) Doctorate

are recorded in Table 6. It is to be noted that first and terminal degree requirements received very limited support, one percent and eight percent respectively of the total responding population. The only significant support for a Doctoral Degree came from persons who were self-employed. Approximately 22 percent of the total population responding felt the minimal degree requirement to practice in a school should be a Specialist's Degree. The only important deviations from this percentage among the sub-population were that percent of the college teachers and 54 percent of the psychologists who had earned a Specialist's Degree felt that the Specialist's Degree should be a minimal requirement. A Master's Degree was recommended by 70 percent of the responding population as a minimal requirement.

Responses to the request:

Circle the one number at the right which indicates the extent to which your regular primary employment is devoted to federally funded programs. (1) None; (2) Less than 10%; (3) 10 to 25%; (4) 26 to 50%; (5) 51 to 75%; (6) 7% to 100%

indicated that less than one-half (43%) of all of those included in the survey had some involvement in federally funded programs as a part of their regular primary employment (Table 7). About one-quarter of the total respondents reported that their involvement in federal programs consumed two percent or less of their time on the job; 21 percent indicated that such involvement ranged from ten to one hundred percent of their primary professional work time. The percentage of responses from all school professionals closely approximated those from non-school professionals.

The data contained in Table 8 reflects responses to the request to

Type or print carefully the complete Federal titles of the programs under which you work and indicate the type of service you perform.

Over one-fourth (27%) of the total respondents revealed that their involvement in federally funded programs was through the Elementary and Secondary Education Act. The remainder of those who indicated federal involvement (14 percent) reported participation in such programs as the Education Professional Development Act, The National Defense Education Act, and the Office of Economic Opportunity. Almost twice as many school personnel than non-school personnel were involved in ESEA programs; whereas, more than three times as many non-school personnel were involved in "other" federal programs of great variety, but with less direct relationship to elementary or secondary education. More than one-half (52%) of the individuals responding indicated that their roles in federally financed programs were those of evaluators (Table 9). Consultative and administrative services constituted the other types of activity most often mentioned. The emphasis in type of

Total percentages over 100% due to multiple responses.

Response to the inquiry regarding the types of federally funded programs which school psychology should promote was generally all-inclusive as revealed in Table 10.

Although no consensus pertaining to specific types of programs was apparent, certain areas received somewhat more attention than others, i. e., in-service training to school psychologists, pre-school consultation and counseling, special education and research. There were no notable differences between the suggestions of school and non-school personnel.

General agreement was evident between school personnel and non-school personnel on the issue of crucial skills which school psychologists need to develop in order to provide adequate services (Table 11). Those skill areas most frequently mentioned were psychological diagnosis, educational programming (general and remedial), professional communication, educational diagnosis, behavior modification and counseling.

^{*}Data reported in percentages.

Responses to the inquiry regarding aspects of school psychology which need national attention were also general and all inclusive as seen in Table 12. The responses were organized into four general areas for reporting purposes. Approximately one-half of all of those who participated in the survey responded to this item of investigation with close agreement between school personnel and non-school personnel on specific areas of need. The area of "professionalism" received the most emphasis with little attention to the areas of skills, programming, and professional knowledge. Within the areas of professionalism, role and function was the most frequently mentioned aspect of school psychology in need of national attention. Licensing and certification, professional programs in diagnostic assessment, and the public image of the school psychologist were also expressed as relatively important points of national concern.

The reaction of survey respondents to the question:

Write in the single title which you feel should generally be used to designate school paychological personnel nationally.

is reported in Table 13. A majority of the survey participants (59%) favored the title "school psychologist" over a variety of alternatives. A higher percentage of school personnel than non-school professionals preferred the title "school psychologist".

Participants were requested to react to the following chart pertaining to the role and function of the school psychologist.

Views of the respondents are reported in Table 14. The definite emphases of professional activity in <u>current primary role</u> were individual psycho-educational evaluations, preparation of written reports and parent-teacher conferences. One-half of the respondents indicated that individual counseling was also a part of their primary role. Consulting activity was much less frequently reported in current primary role responsibility, with limited indicators that behavioral management and educational programming constituted the most frequent areas of consulting involvement. Nearly one-half of the respondents indicated no responsibilities for regular school program evaluation, research or group testing.

The survey results tended to highlight preparation of reports, parent and teacher conferences, individual psycho-educational evaluations and individual counseling as important professional activities in a consideration of the <u>ideal role</u> for the school psychologist. Greater emphasis was placed on consulting activities in the ideal role projection than was reported as the case in the current role. Regular and special program evaluation, behavioral management and educational program planning were the most frequently identified areas for consulting activity in the <u>ideal role</u> projection of the school psychologist.

Data reported in percentages.

Data regarding change in the emerging role of the school psychologist provided little definitive information about the degree or direction of change.

Survey participants reported that the activities which absorbed most of their time, in order of demand, included individual psycho-educational evaluations, report writing, and parent and teacher conferences (Table 15).

NATIONAL REPORT OF MOST TIME CONSUMING ROLES*

Tables 16-17-18-19 present breakdowns of data pertaining to role and function, and most time consuming roles, as viewed by non school APA members, school employed members of APA and members of NASP. Information relating to the current and ideal role of the school psychologist, as well as data on change in the emerging role, was comparable among the sub-groups with no deviation in any group from the impressions reflected by the total data.

School psychologists who work full time in a school system were asked to respond to the following inquiries about their employment.

Circle the one number at the right which best indicates the political or government unit to which your employer is attached. (1) city; (2) town or village; (3) county; (4) combined district.

Circle the one number at the right that corresponds to the student enrollment for the school system in which you are employed. (1) Below 3,000; (2) 3,000-7,999; (3) 8,000-12,999;

- (4) 13,000-17,999; (5) 18,000-22,999; (6) 23,000-27,999;
- (7) 28,000-32,999; (8) 33,000-37,999; (9) 38,000-57,999;
- (10) 58,000-97,999; (11) 98,000-157,999; (12) 158,000 +

Indicate the number of full time school psychologists working for your employer.

Circle the one number at the right corresponding to the salary of your basic school contract. (1) \$5,000-\$6,999; (2) \$7,000-\$9,999; (3) \$10,000-\$11,999; (4) \$12,000-\$14,999. (5) \$15,000-\$17,999; (6) \$18,000-Up.

Circle the one number at the right corresponding to the length of your regular school contract. (1) 9 months; (2) 9 1/2 months; (3) 10 months; (4) 10 1/2 months; (5) 11 months; (6) 12 months

Circle the number at the right which indicates the type of salary schedule under which you are working. (1) Teachers' salary schedule; (2) Teachers' salary schedule plus fixed amount, indexed additional, ratio or other type of arrangement; (3) Administrative salary schedule; (4) Separately negotiated; (5) Other arrangements

Circle the number at the right corresponding to whether your school system receives specific state support for full time school psychologists. (1) Yes; (2) No

Circle the number at the right which indicates whether you are the director of the pupil personnel program in your school system (1) Yes; (2) No

Circle the number corresponding to when you participated in the following activities independent of your regular school contract during the past school year and the present one. Do not circle a number if you have not participated in the activity.

| Activities | Evenings | Saturdays | Summer |
|--|----------|-----------|--------|
| Regular private diagnostic service | 1 | 2 | 3 |
| Regular private counseling service | 1 | 2 | 3 |
| Occasional private diagnostic service | 1 | 2 | 3 |
| Occasional private counseling service | 1 | 2 | 3 |
| Teach at a college or university | 1 | 2 | 3 |
| Work for a public social agency | 1 | 2 | 3 |
| Part-time service to a school district other than the one to | | | |
| which you are regularly contracted | 11 | 2 | 3 |
| Work in a reading clinic | 1 | 2 | 3 |
| Specify other; | 1 | 2 | 3 |
| Specify other: | 1 | 2 | 3 |
| Specify other: | 1 | 2 | 3 |

Circle the number at the right corresponding to whether your school system would:

Reimburse total expenses for at least one state meeting

(1) Yes; (2) No

Reimburse part of the expenses for at least one state meeting

(1) Yes; (2) No

Reimburse total expenses for at least one national meeting

(1) Yes (2) No

Reimburse part of the expenses for at least one national meeting

(1) Yes; (2) No

Information about the governmental type of school district in which the respondents were employed is contained in Table 20.

Table 21 provides student enrollment figures for the school systems in which the respondents were employed. It is note-worthy that the percentage of responses included a cross section of all school enrollment categories. More than one-quarter (28%) of those responding indicated that only part-time school psychological services were provided in their school districts. The data also indicate that, of those school psychologists working in districts providing full-time services, a majority were prepared at a sub-doctoral level; while, among those school psychologists working in districts with less than full-time services, a majority were trained at the doctoral level. Nearly all of the respondents (95%) who reported employment in districts with part-time services indicated that their primary occupation was college teaching.

Psychologist-student service ratios are revealed in Table 22. Thirteen percent of the respondents reported ratios below 1 to 2,000; approximately one-half (49%) of those reporting indicated ratios of less than 1 to 5,000; fewer than one-fourth (23%) of those reporting indicated ratios in excess of 1 to 6,000.

Table 23 contains salary figures for basic school employment contracts. The data indicate that a majority of the respondents received salaries in the \$10,000 to \$17,999 range, with the highest frequency category the \$12,000 - \$14,999 range.

The highest frequency category for Bachelor level training was the \$7,000 to \$9,999 range and the highest frequency categories for doctoral level training were the \$15,000 to \$12,009 and the \$18,000-plus categories. The highest frequency category for Master's, Master's plus 30, and Specialist training levels was the \$12,000 to \$14,999 range.

Information pertaining to length of employment contract is listed in Table 24. The data suggest the ten-month contract as the most popular arrangement, with the twelve-month contract the second most frequently reported agreement.

Table 25 presents statistics relative to types of salary arrangements for school psychologists. The teacher's salary schedule plus a fixed amount, indexed or ratio additional, was the salary arrangement most often indicated by the respondents, with administrative schedule and separately negotiated salary as the next most frequently reported reimbursement determinants.

Most of those reporting on the inquiry regarding state support to their school systems for the employment of school psychologists indicated that their districts did mcceive such state support. (Table 26)

Approximately ten percent of the respondents revealed that their responsibilities as a school psychologist included that of assuming the position of Director of Pupil Personnel Services. The great majority of those reporting indicated no such responsibility.

Table 27 provides information regarding professional services rendered by school psychologists independent of their regular school contracts. The data suggest that most school psychologists do not involve themselves in professional services beyond their regular contractual obligations. Those who do provide independent services appear to favor college or university teaching in the evening and occasional diagnostic services on Saturdays and evenings. The next most frequently indicated private service was occasional demostic and counseling services independent of school responsibilities seem to be quite

limited with very little professional service provided to social agencies or other school districts. Virtually no services of a private nature were reported for reading clinics.

Information relating to reimbursement for professional meeting expenses is presented in Table 28. The data reveal that school systems are most likely to reimburse total expenses for at least one meeting within the state, and/or partial expenses for one state meeting.

Total or partial reimbursement for a national meeting appears to be limited. It seems that city school systems are least inclined to provide reimbursement for meeting expenses, with town/ village and county districts apparently more inclined to do so.

CHAPTER IV REGIONAL DATA ANALYSIS

School psychology developed in the United States with a very limited amount of communication among field personnel in various geographical regions. When a profession develops under such a condition, a question is raised as to whether the perception of the profession's role, areas of responsibility, needs, and future direction might differ according to geographical regions. To determine whether important differences did accrue in these and other areas of concern, data collected were analyzed according to four geographical regions as described on Page 6.

Returns received from 3,138 participants in the survey were geographically distributed as follows: Region 1, Northeastern States 769, Region 2, Southern States 243, Region 3, Midwestern States 1320, and Region 4, Western States 806. (Appendix D contains a breakdown of the number of returns by state) An analysis of the participants' responses by geographical regions is presented below.

Data related to inquiries regarding the employment pattern of the respondents, their sex and ages, are reported in Table 29. The response patterns of the psychologists from the various regions are quite similar. The major employer in each region was a school system, while the percentage of self employed was very small - between one and two percent. Only in Region 2 was there an important difference in the percent of respondents in various employment categories, as compared to the other Regions. In Region 2, the proportion of school personnel was 58 percent, as compared to 76 percent for the next lowest region. Region 2 also had twice as many respondents in the University Staff employment category, as compared with other individual regions.

Male and female distribution of the respondents was generally the same in the various regions with the exception of Region 2. The pattern was approximately 59 percent of the respondents male and 40 percent female (one percent did not respond). Region 2, however, showed a distribution of 64 percent males and 34 percent females, with two percent failing to respond to the questions.

The age pattern of the respondents was quite similar in the various regions. A majority indicated an age range of between 35 and 49 while relatively few psychologists reported being in the age ranges of 25 and below, or 65 and above. The similarity in the age distribution suggests a parallel growth pattern among the regions. The reader's attention is directed to the data in Table 29 which indicate small differences in the age pattern among the various regions.

REGIONAL STRATIFICATION OF ORGANIZATIONAL MEMBERSHIP PATTERNS*

| | TOTAL | REGION 1 | REGION 2 | REGION 3 | REGION 4 |
|-------------------|-------|----------|----------|----------|-------------|
| APA | 41 | 56 | 64 | 34 | 32 |
| State APA | 38 | 50 | 60 | 36 | |
| NASP | 28 | 21 | 28 | 40 | 16 |
| CEC | 28 | 27 | 22 | 33 | 24 |
| APGA State Assoc. | 14 | 11 | 21 | 12 | 20 |
| | 66 | 60 | 49 | 64 | 80 |

^{*} Data reported in percentages.

Data reflecting the professional membership affiliations of psychologists from the four regions are reported in Table 30. Some differences among the regions are evident. APA and State APA affiliations were particularly high in Regions 1 and 2. The percentage of NASP members was highest in Region 3 and affiliation with a state school psychologists association was highest in Region 4. Excepting Region 2, which was strongly oriented toward APA or State APA affiliations, the highest percentage of respondents from all regions acknowledged membership in a state school psychologists association.

Table 31 provides regional data regarding major academic fields for psychologists earned degrees.

Data obtained from responses to the following inquiries are reported in Table 32 or discussed in the paragraphs below:

Circle at the right the one number corresponding to the highest degree you have earned. (1) Bachelor's; (2) Master's; (3) Specialist's; (4) Doctorate.

SKIP QUESTION BELOW IF YOU HAVE A MASTER'S DEGREE OR HIGHER

Circle at the right the number of the correct answer;

- (a) Are you working toward a Master's Degree? (1) Yes; (2) No
- (b) Do you plan to obtain a Master's Degree? (1) Yes; (2) No; (3 Undecided

SKIP QUESTION BEL IF YOU HAVE A DEGREE ABOVE THE MASTER'S LEVEL

- (a) Are you work ng toward a Specialist's Degree? (1) Yes; (2) No
- (b) Do you plan to work toward a Specialist's Degree?
 (1) Yes; (2) No; (3) Undecided
- (c) Are you working toward a Doctorate Degree? (1) Yes; (2) No
- (d) Do you plan to work toward a Doctorate Degree?
 (1) Yes; (2) No; (3) Undecided

Among the four Regions, the pattern of education in terms of degrees earned was similar. Tabulated by regions, only two percent of the respondents were at the Bachelor's Degree level, one to two percent had earned a Specialist's Degree, and between three and five percent had the terminal degree. The percent of psychologists with a Master's Degree ranged from 88 to 93 percent in the various regions. Between 58 and 74 percent of the respective regional respondents reported having earned a Master's Degree, plus at least an additional 30 semester hours of graduate work.

| Undecided | 18 | 14 | 14 | 20 | 20 |

^{*} Data reported in percentages.

While the regional patterns of training in terms of degrees earned were quite similar, there were some differences in terms of the percent of respondents at a particular degree level. Region 1 had the highest percentage of psychologists with a Master's Degree plus thirty semester hours (74%). The percent of respondents from Region 2 in this category was 58. Close inspection of Table 32 will show that Region 1 had the highest level of training, as determined by degrees earned.

Regions in which one or two percent of the respondents were at the Bachelor's Degree level also showed one or two percent of the respondents working toward and planning to earn a Master's Degree. The percent of respondents working toward a Specialist's Degree or planning to work toward such a degree according to Region were: Region 3 - 6% and 5% respectively; Region 2 - 4% and 2% respectively; Region 1 - 3% and 2% respectively; Region 4 - 2% and 1% respectively. While small differences did occur between the Regions, the total percent interested in a Specialist's Degree was so small that no importance can be attached to them.

The percent, by Region, of the respondents working toward a Ph. D., planning to work toward a Ph. D. and undecided at the time they returned the survey is worthy of note in Table 32. These percentages suggest that there is interest in the terminal degree and that this interest is somewhat stronger in Regions 3 and 4 than in the other two Regions.

TABLE 33

REGIONAL DATA STRATIFICATION RELATED TO RECENT COLLEGE COURSE ELECTIONS

AND IN-SERVICE TRAINING*

| | | TOTAL | REGION I | REGION 2 | REGION 3 | REGION 4 |
|--------------------------------|--------------------------|----------|-------------|-------------|-------------|-------------|
| Elected Course i Year - | in Past - Yes - No | 37 61 | 29 68 | 31 65 | 40 58 | 42 56 |
| 3 or More Relate Meetings - | I | 76 20 | 73 23 | 74 22 | 77 20 | 78 17 |

^{*} Data reported in percentages.

Data reported in Table 33 are psychologists' responses to the questions:

During the past year have you elected a course for credit at a college or university? (1) Yes; (2) No

During the past two years have you attended a continuing (three or more related meetings) organized professional development program in which you were not a speaker? (1) Yes; (2) No

They reflect a continuing interest in becoming a more effective practitioner. Data indicate that in Regions 3 and 4, slightly more than a third of the respondents had elected a college course during the past year. The percentages were slightly less than a third in Regions 1 and 2. Approximately two-thirds of the respondents in each of the regions acknowledged having attended an organized professional development program of at least three or more meetings during the past two years. As with previous questions, the pattern among the Regions was similar.

The extent to which referral agencies were used by respondents from the various regions is reported in Table 34. Data in this Table were collected when responses to the following request were tabulated:

Circle at the right the numbers that correspond to services you have made referrals to during the past year.

- (1) Family Services: (2) Juvenile Court; (3) Agency for unwed mothers; (4) Diagnostic Clinic; (5) Reading Clinic;
- (6) Welfare Board; (7) Private Psychologist; (8) Private Psychiatrist; (9) Detention Home; (10) Tutorial Service;
- (11) Dentist; (12) M. D. General; (13) M. D. Neurologist;
- (14) Institutionalization; (15) M. D. Eye-Ear

Inspection of Table 34 will show that practitioners from all regions took advantage of referral opportunities. The general pattern of the use of referral services by respondents in any one region was not radically different from the patterns apparent in other regions. The percentage of respondents from region to region using a particular service did differ in some cases, suggesting some differences in practice from region to region. Examples of these differences are reflected in the fact that only 27 percent of the practitioners from Region 4 used an institutional referral, while 41 percent of the respondents from Region 1 used this referral; 67 percent of the respondents in Region 1 used a private psychiatric referral, while in Region 3, 52 percent of the psychologists made such referrals. It must be emphasized, however, that the general pattern of referral was the same among the Regions.

REGIONAL DATA STRATIFICATION RELATED TO THE UTILIZATION OF REFERRAL.

| M. D. Eye - Ear | 46 | 43 | 43 | 51 | 41 |

^{*}Data reported in percentages.

Data in Table 35 contain, by region, the school certification pattern of psychologists responding to the request to

Circle at the right the numbers that correspond to areas in which you are or have been certified or licensed to work in a school. (1) Elem. Teach.; (2) Sec. Teach.; (3) Counselor; (4) Admin.; (5) Visiting Teach.; (6) Sch. Psych.; (7) Speech Therapist; (8) No certification or license (past or present) in above areas.

Record in the space provided the number of years you have worked part or full time in the following settings independent of a regular school contract you may have had. (Do not count internship time.)

Inspection of Table 35 will show that in all regions, multiple certification in a school related area was evident with better than 90 percent of the persons responding in Regions 2, 3 and 4 certified to teach at either the elementary or secondary school levels. Sixtynine percent of the respondents in Region 1 were certified to teach at these levels. The only other significant differential among the regions was that 65 percent of the respondents in Region 4 were also certified as counselors. The next highest regional percentage in this category was 42 percent in Region 2. Generally, the pattern among the regions was quite similar. Regional responses to the request to: Circle at the right the one number corresponding to the minimal degree requirement you feel should be required of school psychologists working full time in a school system. (1) Bachelor's; (2) Master's; Specialist's; (4) Doctorate. 1 2 3 4, are reported in Table 36. Inspection of this data will show that with one exception, Region 1, the percentages of respondents among the Regions favoring a particular level of training were about the same. In Region 1, almost double the percentage of respondents favor a Specialist's Degree as a minimal level as compared to the other Regions. In all regions, a majority of respondents favored the Master's Degree as a minimal entrance level.

Regional responses to the request

Circle the one number at the right which indicates the extent to which your regular primary employment is devoted to federally funded programs. (1) None; (2) Less than 10%; (3) 10 to 25%; (4) 26 to 50%; (5) 51 to 75%; (6) 76 to 100%

Table 37 indicated that the percentage figure for Regions 3 and 4 closely approximated one another. About one-half of the respondents indicated no involvement in federally funded programs. Approximately one-quarter of those reporting spent less than ten percent of their work time in federally funded programs, with approximately another quarter of the respondents indicating that such involvement consumed from ten to one hundred percent of their primary professional time.

REGIONAL DATA STRATIFICATION RELATED TO CERTIFICATION PATTERNS OF PSYCHOLOGISTS*

| Doctorate | 3 | 5 | 6 | 2 | 3 |

^{*} Data reported in percentages

REGIONAL DATA STRATIFICATION RELATED TO PERCENTAGE OF INVOLVEMENT IN FEDERALLY FUNDED PROGRAMS*

| | TOTAL | REGION 1 | REGION 2 | REGION 3 | REGION 4 |
|---------------------------------------|-------|-------------|----------|----------|-------------|
| Percent of time in Federal Program | | | | | |
| - None | 51 | 56 | 45 | 53 | 46 |
| - Less than 10 | 22 | 23 | 12 | 21 | 25 |
| - 10 to 25 | 10 | 8 | 13 | 9 | 12 |
| - 26 to 50 | 4 | 3 | 5 | 4 | 4 |
| - 51 to 75 | 1 | 1 | 2 | 1 | 1 |
| - 76 to 100 | 6 | 4 | 16 | 6 | 6 |

^{*} Data reported in percentages.

The percentages for Region 2 showed the greatest discrepancy from the national survey figures, with twelve percent of the respondents indicating less than 10 percent involvement in federal programs, but 36 percent of those responding revealing involvement ranging from 10 to 100 percent.

The percentages for Region 1 also reflected a noteworthy difference from the other regions in that only 16 percent of all those responding reported more than 10 percent involvement of work time in federal programs.

The data contained in Table 38 reflects responses to the request to

Type or print carefully the complete Federal titles of the programs under which you work and indicate the type of service you perform.

| | Federal Title | Type of Service Performed |
|---|---------------|---------------------------|
| 1 | | · |
| 2 | | |
| 3 | | |
| 4 | | |

The percentage responses for Regions 1, 3 and 4 were very close with regard to involvement in specific federal programs. The total percentage figures for Region 2 differed slightly from the other regions in that less than one-fourth of those reporting revealed that their involvement was through the Elementary and Secondary Act, as compared to ESEA figures exceeding one-fourth for the other region generally. Percentage figures for Region 2 differed markedly from regional percentages pertaining to involvement in "other" federal pagrams of great variety, but with less direct relationship to education. The percentage figure for Region 2 was approximately 10% higher than other figures for regions 1, 3 and 4 in the "other" federal program category.

More than one-half of the individuals responding in regions 1, 3 and 4 indicated that their roles in federally financed programs were those of evaluators (Table 39). Only 43 percent of those reporting in Region 2 indicated roles as evaluators, although Region 2 percentage figures for the roles of instructor and administrator in federal programs exceeded other regional figures notably.

Responses to the inquiry regarding the types of federally funded programs which school psychology should promote showed general agreement among all of the regions (Table 40). All four regions gave similar emphasis to those specific types of programs highlighted in the national figures, i.e., in-service training to school psychologists, pre-school consultation and counseling, special education and research.

The respondents in all of the regional areas revealed agreement on the issue of crucial skills which school psychologists need to develop in order to provide adequate services (Table 41). The national emphases in skill areas reflected those skills emphasized in each of the regions, i.e., psychological diagnosis, educational programming, professional communication, educational diagnosis, behavior modification, and counseling.

Responses to a question, regarding aspects of school psychology which need national attention, indicated no differences among the regions (Table 42). All four of the regions emphasized role and function, licensing and certification, professional programs in diagnostic assessment, and the public image of the school psychologist as relatively important areas in need of national professional attention.

The reaction of survey respondents to the question

Write in the single title which you feel should generally be used to designate school psychological personnel nationally.

is reported in Table 43. A majority of the survey participants in each region favored the title "school psychologist".

Respondents of the four regions indicated great agreement and very little difference of opinion in their reactions to the question regarding the role and function of school psychologists currently and ideally. The responses of each region were comparable to the national results on this question. The reader is referred to Table 14, Chapter III for a present and discussion of the total survey data rating to role and function of the school psychologist. Statistics regarding role and function for each region are provided in the supplementary Regional reports in Appendix E.

School psychologists who work full time in a school system were asked to respond to a variety of inquiries relating to their employment. The requests for information about professional employment included the following:

Circle the one number at the right which best indicated the political or government unit to which your employer is attached. (1) city; (2) town or village; (3) county; (4) combined district

Circle the one number at the right that corresponds to the student enrollment for the school system in which you are employed. | County | 16 | 14 | 33 | 14 | 16 |
| Combined District | 15 | 14 | 8 | 14 | 19 |

^{*} Data reported in percentages.

National and regional student enrollment figures for the school systems in which the respondents were employed are contained in Table 45.

The percentage of survey participants contained in Tables 44 and 45 suggests that the survey responses represent a cross section of school districts and school enrollment categories for each of the four regions.

The numbers of full time psychologists employed in the school districts of the survey participants are presented on a national and regional basis in Table 46. Data for Regions 1, 3 and 4 are similar; approximately one-fourth of the respondents in these regions indicated that only part-time psychological services were provided in their school districts. The percentage figures for Region 2 reveal that nearly one-half of the responding school districts in that region received less than full time school psychological services. Nearly one-half of the respondents in Regions 3 and 4, and over one-half of the respondents in Region 1, indicated that from one to five full time school psychologists were employed in their districts, whereas only one-fifth of the respondents in Region 2 reported equivalent full time services. Region 2 respondents indicated, however, the highest percentage, among the four regions, of school districts employing from six to fifty-plus full-time psychologists.

^{*} Data reported in percentages.

Salary figures for basic school employment contracts are presented nationally and for the respective regions in Table 48. The percentages indicate that the highest frequency category for each of the four regions was the \$12,000 - \$14,999 range. The majority of the respondents in Regions 1 and 4 received salaries in the \$10,000 to \$17,999 range. The majority of the respondents in Region 3 received salaries in the \$7,000 - \$17,999 range. Forty-two percent of the respondents in Region 2 reported salaries in the \$7,000 - \$14,999 range, with eight percent of the respondents indicating salaries in excess of \$15,000.

Table 49 includes national and regional information regarding the length of employment contract for school psychologists. The percentages suggest that the ten month period is the most frequently reported

contract for Regions 1, 3 and 4, with the twelve-month arrangement the next most frequently reported. The twelve-month contract was the most frequently reported and the ten-month contract the next most frequently mentioned for Region 2.

The national and regional statistics regarding types of salary schedules for school psychologists are presented in Table 50. The teacher's salary schedule plus a fixed amount, indexed or ratio additional, was the most often indicated salary arrangement by the respondents in all four regions. Administrative schedule and separately negotiated salary were the next most frequently cited types of financial arrangements in all regions.

| | No | 24 | 31 | 26 | 6 | 45 |

^{*} Data reported in percentages.

Most of those responding to the question regarding state support to their school systems for the employment of school psychologists indicated an affirmative answer in Regions 1 and 3 and a negative answer in Regions 2 and 4 (Table 51).

The majority of those reporting in all four regions indicated no responsibility as Director of Pupil Personnel Services.

Table 52 provides national and regional information relating to professional services offered by school psychologists outside of their regular school contracts. The data for all regions suggest that most school psychologists do not involve themselves in professional services beyond their regular contractual obligations. Those in all four districts who do provide independent services seem to favor college teaching in the evening and occasional diagnostic service in the evening and on Saturdays. Occasional counseling in the evening was also identified as a relatively popular activity in private service for respondents in all regions.

National and regional information regarding reimbursement for professional meeting expenses is presented in Table 53. The data reveal that school systems in each of the four regions are most likely to reimburse total expenses for at least one meeting within the state and/or partial expenses for one state meeting.

Total or partial reimbursement for a national meeting seems to be limited in all regions, but especially in Region 4.

CHAPTER V Summary and Conclusions

The national survey of school psychologists was made to determine the present status of school psychology, establish baselines from which to interpret future studies, and to indentify national issues and concerns. Past studies of the Profession had been handicapped by the lack of a comprehensive national mailing list and financial support. The principal investigators of this study took advantage of the mailing list of the newly organized (1969) National Association of School Psychologists (NASP) and funds provided by NASP, the federal government, and the University of Akron Faculty Research Committee. To assure as large an impact as possible, the original mailing list was augmented by the mailing list of Division 16 of APA and input from the CEC mailing list.

The survey was designed to facilitate a data analysis using the following parameters as controls: professional memberships, primary employer, highest degree earned, teaching experiences, size of student enrollment, and political location of the school system. In addition, a non-stratified analysis was made by geographical regions, and by selected states based upon the number of returns. The design referred to was followed in order to determine the extent of convergence or divergences within the profession on the various points investigated.

Based upon the percent of returns to a very short questionnaire using a national mailing list compiled by the founders of NASP, a high percentage of returns was anticipated for the study being reported. During February of 1970, survey questionnaires were mailed to 9432 persons on a mailing list that had been greatly expanded when compared to the original NASP mailing list. The questionnaire sent out was quite comprehensive and took a minimum of forty-five minutes to an hour to complete. Total usable returns were 3138 or only 33 percent of the mailing. Inadequate addresses resulted in 850 pieces of mail being returned unopened; excluding the returned questionnaires, responses were received from 37 percent of the population surveyed. Interpretation of all findings, therefore, must take into account the limited size of the return.

At the time the survey was mailed, NASP had 1399 members of which 900, or 64 percent, returned their questionnaires. This percentage comes close to the percent of returns that had been projected for the total mailing. One might speculate that the NASP membership was composed of a large core of professional activists. Because the percent of the total population having memberships in other organizations was not available, similar comparisons could not be made.

The survey reflects to a large extent data collected from school psychologists who considered their primary employer a school system. Of the 3138 psychologists who returned their questionnaire, approximately 79 percent were primarily employed by a school system. While the representativeness of these returns may be in question, the data reflects, beyond doubt, the concerns and positions of a significant segment of the practicing school psychologists in the United States.

Approximately 71 percent of the respondents were thirty-five years of age or older. Looking across the control variables, the oldest groups were respondents whose primary occupation was college teaching and respondents from school systems with 158,000 + students. The age range of the respondents may be a reflection of the fact that about 74 percent of the school psychologists responding had teaching experience at the elementary or secondary school levels and a considerable percent (43) have or had counselor certification in addition to being certified as a school psychologist. It is evident that of the population responding, relatively few school psychologists proceeded directly into the profession of school psychology.

School psychologist's certification requirements in many states include a teaching certificate. Should the pattern of including such a certificate break down, and there is some indication that this is happening (note Ohio's new school psychologists certification pattern), it is possible that the percent of younger school psychologists will increase as the result of new entry procedures into the profession.

The percent of male and female school psychologists responding to the survey was 59 and 40 respectively. While this data shows a majority of the responding school psychologists were male, it also indicates general acceptance of women in the profession. A breakdown of the data by the political location of school systems indicates that the percentage of males to females is closest in city school systems; 51 to 47 percent respectively.

Analysis of the data across professional membership affiliations was somewhat clouded as a result of the large number of school psychologists who had multiple professional memberships. For example, of the 900 NASP members responding, 33 percent indicated having a membership in APA. Multiple memberships may account to some extent for the relatively few major differences in responses from members of different organizations. If support for a further analysis of the data is available, it will be made across memberships with psychologists holding multiple memberships excluded.

Multiple certification was about as common as multiple membership patterns among school psychologists, with the most popular areas of certification being secondary teacher, counselor, elementary teacher and administrator. The extent of certification in school areas suggests a strong orientation toward the education profession.

Analysis of data related to both formal and informal training of the responding population suggests school psychologists are a highly educated professional group. Sixty seven percent of the respondents had earned either a Master's Degree plus thirty semester hours, a Specialist Degree or a Doctorate Degree. A total of seven percent of the population was working or planning to work toward a Specialist Degree and twenty-seven percent was working or planning to work toward a Doctor's Degree.

While a clear pattern of the course content elected by this school psychologist population was not available, responses indicated that 56 percent of the Master's Degrees were in the area of Psychology, 33 percent in Education, and 10 percent in other undesignated areas. Course pattern elections beyond the Master's Degree were not ascertained.

In addition to an extended formal education pattern, 76 percent of the population responding indicated that during the past two years they had attended at least one continuing professional development program consisting of three or more related meetings. It may be implied from this data that school psychologists are concerned with keeping abreast with new trends in the profession.

While a complete picture of the educational pattern was not available, with the exception of the 1 percent of the population at the Bachelor's level, there was little or no evidence indicating lack of preparation. It is even possible, when cognizance is taken of the number of semester hours Ph D holders receive for their dissertation research, that many of the school psychologists with a Master's Degree plus thirty or more semester hours are as well prepared to be field practitioners as the terminally trained person.

Keeping in mind the above findings, it is not surpising to find that even among respondents trained at the Doctor's Degree level, only 13 percent indicated that entry into school psychology should be at the terminal degree level.

The data collected suggest that a large percentage of school psychologists are inclined to make referrals to both private and public services when the need exists: Most used sources included Family Service, Diagnostic Clinics, and general and specialized members of the medical profession. Agencies not as often used include homes for unwed mothers, Juvenile Courts, Welfare Boards, Detention Homes, Dentists, and referrals for Institutionalization. Services not used may reflect the tendency for school psychologists to service elementary

school age students more than secondary.

Results of this survey indicate that school psychologists have far less than maximal involvement in federal programs. Less than half of those reporting were participants in federally financed projects and about one-quarter of the respondents revealed that such participation involved ten per cent or less of their professional time. This limited involvement in federal programs was mainly through the Elementary and Secondary Education Act with very little professional activity in programs eminating from the Education Professional Development Act, the National Defense Education Act, the Office of Economic Opportunity, or the National Institute of Mental Health.

The survey respondents generally felt that there was a definite need for school psychologists to be more involved in nationally supported programs and specifically revealed the need for school psychology to promote federal attention to professional in-service training programs, pre-school consultation and counseling programs, special education and educational research.

The professional skills of the school psychologist which are most critically in need of development, according to this study, include psychological and educational diagnosis, educational programming, behavioral modification planning, counseling and professional communication. The emphasis on these "direct involvement" skills suggests their importance in current professional practice and reveals the concern of school psychologists about improving their roles as "change agents" within the school.

Regarding the matter of which internal aspects of school psychology need the national attention of school psychologists for resolution within the profession, role and function was most frequently mentioned. Licensing, certification and the public image of the school psychologist were also highlighted.

These findings indicate that school psychology continues to have, or feels it has, a problem of uncertain or insecure professional identity. It might be said that this problem, felt by school psychologists across the country, has fundamental and significant implications for the future of the profession and should command the first priority of national intra-professional study. Since national communication among practicing school psychologists has been very limited, however, and since the results of this study suggest much homogeneity in the practice of school psychology throughout the mation, the problem of professional identity may not actually exist to the extent reflected by those responding to this survey. It is also possible that the nature of the problem regarding role and function may not be one of uncertainty, but one of national dissatisfaction. The issue stands out for national professional clarification and resolution.

The national commonality regarding current role and function of school psychologists seems apparent in this study. Individual examinations, preparation of written reports and parent-teacher conferences appear to describe, in essence, the practice of school psychology throughout the country. This delineation of role and function tends to reflect an "evaluator" and "reporter of test results" characterization.

Counseling, program planning and evaluation, behavioral management, and consultation were reported by survey respondents as desirable activities in a projection of the ideal role and function of the school psychologists.

Survey information relating to emerging change in role and function was sparse and confused. This suggests that the professional identity problem of school psychology may not be one of specifying current role and function, or one of describing ideal role and function. The problem might be one of structuring a means for change including definitive procedures and strong support for transition.

Participants in this study were asked to provide detailed information pertaining to their employment in the schools. The majority of those reporting on the inquiry megarding mervice ratios revealed ratios in excess of one psychologist for every 2,000 students, with a high percentage of respondents indicating ratios between 1-2,000 and 1-5,000. This information suggests a critical manpower shortage in school psychology of national scope.

The highest frequency data for salary categories occurred for the \$12,000 - \$14,999 range, with the ten-month contract reported as the most frequent annual employment period.

Data regarding "private practice" indicate that most school psychologists do not involve themselves in professional services beyond their regular contractual obligations. Those school psychologists who do engage in outside activity seem to choose college teaching for the most part.

Generally, school psychologists mem to receive reimbursement for state professional meetings and occasionally have expenses paid for national conventions.

Analysis of data across four geographical regions (Northeastern States N = 769), (Southern States N = 243), (Midwestern States N = 1320) (Western States N = 806) indicated that generally the pattern of responses by region were similar. The data seemed to indicate that although limited communication took place between school psychologists in various parts of the country (especially those at the Masters Degree level of training), needs, concerns, role patterns, and

demographic descriptions were quite similar.

A significant difference by geographical region was reflected in the size of regional mailings and subsequent returns. In some instances they reflect centers of population but in others they may reflect limited programs in school psychology. (Note data related to the number of surveys mailed and returned in Appendix D.)

Recommendations:

- 1. That a comprehensive program of in-service workshop training of school psychologists be planned by the profession and implemented by federal and state governments through such a vehicle as the Educational Professional Development Act, in order to provide further development of the critical skills identified in the survey.
- 2. That a national effort by professional school psychologists' associations be made to examine and clarify the current and future role and function of the school psychologist in terms of anticipated educational and mental health needs of students.
- 3. That a national program for manpower recruitment and training be designed by the profession and supported by federal funding to reduce the apparent professional shortages in school psychology as revealed in the high psychologist-student service ratios.
- 4. That a national program of inter-state reciprocity regarding licensing and certification of whool psychologists be formulated by national professional groups in conjunction with state departments of education.
- 5. That national training and accreditation standards and guidelines be developed to provide for the most efficient and effective production and practice of school psychologists.

ያፈ

CHAPTER VI

Chapter VI contains a breakdown of the data for 18 states from which 50 or more psychologists responded. The reader is encouraged to compare the number of returns with the total number of surveys mailed for each state in order that an appropriate perspective for interpretation of the data be established.

Data regarding the current and future educational endeavoms of the respondents indicated:

- a. One percent were working toward a Specialist's Degree.
- b. None planned to work toward a Specialist's Degree.
- c. Twelve percent were working toward a Doctorate Degree while forty percent were not.
- d. Ten percent planned to work toward the Doctorate Degree while eighteen percent did not.
- e. Fourteen percent stated they were undecided about working toward the Doctorate.
- f. Fifty-eight percent did not respond to this question.

During the past year forty-five percent of the respondents elected a course for credit at a college or university while 52% did not. (3% of the data was not accounted for).

During the past two years 70% of the members attended a continuing (three or more related meetings) organized professional development program at which they did not serve as a speaker.

| Specialist's | 1 |
| Doctorate | 3 |
| Master's + 30 | 68 |
| * 3% of the data not account | ed for. |

Data regarding the current and future educational endeavors of the respondents indicated:

- a. One percent were working toward a Master's Degree.
- b. Two percent were working toward a Specialist's Degree.
- c. One percent planned to work toward a Specialist's Degree.
- d. Sixteen percent were working toward a Doctorate Degree while fifty percent were not.
- e. Twelve percent planned to work toward the Doctorate Degree while twenty-six percent did not.
- f. Twenty percent stated they were undecided about working toward the Doctorate.
- g. Forty-two percent did not respond to this question

During the past year forty-two percent of the respondents elected a course for credit at a college or university while 55% did not. (3% of the data was not accounted for).

During the past two years 80% of the members attended a continuing (three or more related meetings) organized professional development program at which they did not serve as a speaker.

Data regarding the current and future educational endeavors of the respondents indicated:

- a. Fifteen percent were working toward a Specialist's Degree.
- b. Six percent planned to work toward a Specialist's Degree.
- c. Six percent were working toward a Doctorate Degree while thirty-one percent were not.
- d. Five percent planned to work toward the Doctorate Degree while nineteen percent did not.
- e. Thirteen percent stated they were undecided about working toward a Doctorate.
- f. Sixty-three percent did not respond to this question.

During the past year forty-two percent of the respondents elected a course for credit at a college or university while 57% did not. (1% of the data was not accounted for).

During the past two years 71% of the members attended a continuing (three or more related meetings) organized professional development program at which they did not serve as a speaker.

| * 2% of the data not accounted | d for. |

Data regarding the current and future educational endeavors of the respondents indicated:

- a. One percent were working toward a Specialist's Degree.
- b. Two percent planned to work toward a Specialist's Degree.
- c. Eighteen percent were working toward a Doctorate Degree while fifty percent were not.
- d. Thirteen percent planned to work toward the Doctorate Degree while twenty-five percent did not.
- e. Nineteen percent stated they were undecided about working toward a Doctorate.
- f. Forty-three percent did not respond to this question.

During the past year thirty-five percent of the respondents elected a course for credit at a college or university while 62% did not. (3% of the data was not accounted for).

During the past two years 72% of the members attended a continuing (three or more related meetings) organized professional development program at which they did not serve as a speaker.

Data regarding the current and future educational endeavors of the respondents indicated:

- a. One percent were working toward a Specialist's Degree.
- b. None were planning to work toward a Specialist's Degree.
- c. Six percent were working toward a Doctorate Degree while forty-one percent were not.
- d. Six percent planned to work toward the Doctorate Degree while twenty-five percent did not.
- e. Sixteen percent stated they were undecided about working toward a Doctorate.
- f. Fifty-three percent did not respond to this question.

During the past year thirty-three percent of the respondents elected a course for credit at a college or university while 66% did not. (1% of the data was not accounted for).

During the past two years 84% of the members attended a continuing (three or more related meetings) organized professional development program at which they did not serve as a speaker.

Data regarding the current and future educational endeavors of the respondents indicated:

- a. Fourteen percent were working toward a Specialist's Degree.
- b. Eleven percent planned to work toward a Specialist's Degree.
- c. Seven percent were working toward a Doctorate Degree while fifty-eight percent were not.
- d. Nineteen percent planned to work toward the Doctorate Degree while thirty-three percent did not.
- e. Seventeen percent stated they were undecided about working toward a Doctorate.
- f. Thirty-one percent did not respond to this question.

During the past year thirty-four percent of the respondents elected a course for credit at a college or university while 65% did not. (1% of the data was not accounted for).

During the past two years sixty-eight percent of the members attended a continuing (three or more related meetings) organized professional development program at which they did not serve as a speaker.

| Master's | 30 |
| Specialist's | 0 |
| Doctorate | 3 |
| Master's + 30 | 52 |
| * 2% of the data not accounted | for. |

Data regarding the current and future educational endeavors of the aspondents indicated:

- a. Three percent were working toward a Master's Degree.
- b. Three percent were working toward a Specialist's Degree.
- c. One percent planned to work toward a Specialist's Degree.
- d. Twenty-two percent were working toward a Doctorate Degree while forty-one percent were not.
- e. Thirteen percent planned to work toward the Doctorate Degree, eighteen percent did not.
- f. Sixteen percent stated they were undecided about working toward a Doctorate.
- g. Fifty-three percent did not respond to this question.

During the past year thirty-five percent of the respondents elected a course for credit at a college or university while 62% did not. (3% of the data was not accounted for).

During the past two years 77% of the members attended a continuing (three or more related meetings) organized professional development program at which they did not serve as a speaker.

| Masters + 30 | 63 |
| * 2% of the data not accounted | for. |

Data regarding the current and future educational endeavors of the respondents indicated:

- a. Twelve percent were working toward a Specialist's Degree.
- b. Five percent planned to work toward a Specialist's Degree.
- c. Twelve percent were working toward a Doctorate Degree while forty-four percent were not.
- d. Eight percent planned to work toward the Doctorate Degree while twenty-eight percent did not.
- e. Sixteen percent stated they were undecided about working toward a Doctorate.
- f. Forty-eight percent did not respond to this question.

During the past year thirty-five percent of the respondents elected a course for credit at a college or university while 64% did not. (1% of the data was not accounted for).

During the past two years 77% of the members attended a continuing (three or more related meetings) organized professional development program at which they did not serve as a speaker.

| Doctorate | 9 |
| Masters + 30 | 60 |
| * 4% of the data not accounte | d for. |

Data regarding the current and future educational endeavors of the respondents indicated:

- a. Seven percent were working toward a Specialist's Degree.
- b. Three percent planned to work toward a Specialist's Degree.
- c. Fifteen percent were working toward a Doctorate Degree while twenty-one percent were not.
- d. Nine percent planned to work toward the Doctorate Degree while seven percent did mt.
- e. Fifteen percent stated they were undecided about working toward a Doctorate.
- f. Sixty-nine percent did not respond to this question.

During the past year twenty-one percent of the respondents elected a course for credit at a college or university while 78% did not. (1% of the data was not accounted for).

During the past two years 76% of the members attended a continuing (three or more related meetings) organized professional development program at which they did not ærve as a speaker.

| Masters + 30 | 7 5 |
| * 3% of the data not accounted | for. |

Data regarding the current and future educational endeavors of the respondents indicated:

- a. One percent were working toward a Specialist's Degree.
- b. Two percent planned to work toward a Specialist's Degree.
- c. Seventeen percent were working toward a Doctorate Degree while forty-five percent were not.
- d. Thirteen percent planned to work toward the Doctorate Degree twenty-five percent did not.
- e. Seventeen percent stated they were undecided about working toward a Doctorate.
- f. Forty-five percent did not respond to this question.

During the past year twenty-three percent of the respondents elected a course for credit at a college or university while 75% did not. (2% of the data was not accounted for).

During the past two years 67% of the members attended a continuing (three or more related meetings) organized professional development program at which they did not serve as a speaker.

| Doctorate | 2 |
| Masters + 30 | 55 |
| Did not respond | 3 |

Data regarding the current and future educational endeavors of the respondents indicated:

- a. One percent were working toward a Master's Degree.
- b. Four percent were working toward a specialist's Degree.
- c. Six percent planned to work toward a Specialist's Degree.
- d. Seventeen percent were wrking toward a Doctorate Degree.
- e. Fifteen percent planned to work toward the Doctorate Degree.
- f. Twenty-four percent stated they were undecided about working toward the Doctorate.
- g. Thirty five percent did not respond to this question.

During the past year, thirty-seven percent of the respondents elected a course for credit at a college or univer ity while 61% did not. (2% of the data was not accounted for).

During the past two years seventy-nine percent of the members attended a continuing (three or more related meetings) organized professional development program at which they did not serve as a speaker.

|--|------------|
| Degree | ercentage* |
| Bachelor's | 0 |
| Master's | 16 |
| Specialist's | 2 |
| Doctorate | 6 |
| Masters + 30 | 74 |
| * 2% of the data not account | ed for. |

Data regarding the current and future educational endeavors of the respondents indicated:

- None were working toward a Specialist's Degree.
- Ъ. No one planned to work toward a Specialist's Degree.
- Sixteen percent were working toward a Doctorate Degree while thirty-four percent were not.
- Seven percent planned to work toward the Doctorate Degree while twenty-two percent did not.
- Twelve percent stated they were undecided about working toward a Doctorate.
- f. Fifty-nine percent did not respond to this question.

During the past year twenty-four percent of the respondents elected a course for credit at a college or university while 72% did not. (4% of the data was not accounted for).

During the past two years eighty percent of the members attended a continuing (three or more related meetings) organized professional development program at which they did not serve as a speaker.

| Master's | 37 |
| Specialist's | 0 |
| Doctorate | 1 |
| Masters + 30 | 61 |
| * 1% of the data not accou | inted for |

Data regarding the current and future educational endeavors of the respondents indicated:

- a. Seven percent were working toward a Specialist's Degree.
- b. Six percent planned to work toward a Specialist's Degree.
- c. Nineteen percent were working toward a Doctorate Degree while fifty percent were not.
- d. Thirteen percent planned to work toward the Doctorate Degree while thirty-one percent did not.
- e. Nineteen percent stated they were undecided about working toward a Doctorate.
- f. Thirty-seven percent did not respond to this question.

During the past year fifty percent of the respondents elected a course for credit at a college or university while 48% did not. (2% of the data was not accounted for).

During the past two years seventy-nine percent of the members attended a continuing (three or more related meetings) organized professional development program at which they did not serve as a speaker.

NATIONAL SURVEY OF SCHOOL PSYCHOLOGISTS

We are pleased to inform you that the questionnaire for the first national comprehensive survey of school psychologists has been prepared, piloted and is ready for mailing to nearly nine thousand school psychologists across the country (see mimeographed specimen of questionnaire enclosed).

This important research effort will actually begin soon after the first of the year with mailing scheduled for January 10, 1970.

The results of this study will provide valuable information to state and federal professional, educational and governmental agencies. The data will be analyzed and reported in terms of national scope, specific states, educational background of the participants, etc.

It is essential that this study receive the broadest publicity and support possible.

The assistance of your organization in emphasizing the value of this study and encouraging every individual to complete and return his questionnaire will be of great help.

Mention of the study and its significance at meetings, conferences and in newsletters and various other mailings will be of specific assistance in assuring a high return.

Your earnest cooperation is meded and appreciated.

NATIONAL SURVEY OF SCHOOL BYCHOLOGISTS

Dear Colleague:

One of the more rapidly expanding divisions within psychology is that related to the provision of psychological services to school age children. Provision of such services takes place within the school setting, through private practice, and in public agencies. Enclosed is a questionnaire designed to survey the status of this expanding service.

Need for such a survey has been expressed by clinicians, university personnel, government officials, and practitioners within the school setting. Through funds provided by the National Association of School Psychologists, the University of Akron, and the Federal Government, a mailing list of close to nine thousand professionals has been assembled and a national research design developed which will facilitate a break-down of data according to states, professional affiliations (such as Division 16 APA, NASP and CEC) and educational background.

The reliability of the survey results will depend upon a large return. State psychological associations, state departments of education, national psychological associations, and Federal educational agencies are all anxious to obtain the results. Several state school psychologist associations, such as those in California, Illinois, and Ohio, plan to use the state break-down of the national survey rather than to conduct their own intra-state surveys. It is obvious that state results will be reliable only if everyone accepts the professional responsibility to return the enclosed questionnaire.

PLEASE COMPLETE AND RETURN TYOUR QUESTIONNAIRE IN THE ENCLOSED ENVELOPE IMMEDIATELY.

Thank you for your cooperation.

Professionally yours,

Kenneth C. Hoedt Chairman, Research Committee

William H. Farling Executive Director

NATIONAL SURVEY
OF
SCHOOL PSYCHOLOGISTS
The University of Akron
College of Education
Akron, Ohio 44304

Within the past two weeks you received a questionnaire designed to survey the present status of psychological services for school age children. Returns thus far are encouraging but not complete. PLEASE, if you have not already done so, accept the professional responsibility to complete and return your questionnaire. Use of the data collected by state and national organizations depends upon a high return.

Kenneth C. Hoedt, Chairman Research Committee William H. Farling Executive Director

| Specialist's | 1 |
| Doctorate | 4 |
| Master's + 30 | 74 |
| * 3% of the data not account | ted for |

Data regarding the current and future educational endeavors of the respondents indicated:

- a. Three percent were working toward a Specialist's Degree.
- b. Two percent planned to work toward a Specialist's Degree.
- c. Sixteen percent were working toward a Doctorate Degree.
- d. Nine percent planned to work toward the Doctorate Degree while twenty-two percent did not.
- e. Fourteen percent stated they were undecided about working toward the Doctorate.
- f. Fifty-five percent did not respond to this question.

During the past year 29% of the respondents elected a course for credit at a college or university while 68% did not (3% of the data was unaccountable).

During the past two years 73% attended a continuing (three or more related meetings) organized professional development program at which they did not serve as a speaker.

^{*} Respondents were asked to proceed according to the following directions in completing the Role and Function Chart:

After each listed activity, circle the number of the <u>one</u> response in each of Columns A, B and C that best describes:

Column A, Your present primary role as a psychologist or school psychologist.

Column B, The ideal primary role (i.e.) as you would like to see the role of the School psychologist.

Column C, The general change you see (if any) in the emerging role of the school psychologist in the field.

| Doctorate | 3 |
| Master's + 30 | 58 |
| * 2% of the data not accoun | ted for. |

Data regarding the current and future educational endeavors of the respondents indicated:

- a. One percent were working toward a Master's Degree.
- b. Six percent were working toward a Specialist's Degree.
- c. Five percent planned to work toward a Specialist's Degree.
- d. Fifteen percent were working toward a Doctorate Degree while fifty percent were not.
- e. Thirteen percent planned to work toward the Doctorate Degree while twenty-six percent did not.
- f. Twenty percent stated they were undecided about working toward the Doctorate.
- g. Forty one percent did not respond to this question.

During the past year forty percent of the respondents elected a course for credit at a college or miversity while 58% did not. (2% of the data ress not accounted for).

During the past two years 77% of the members attended a continuing (three or more related meetings) organized professional development program at which they did not serve as a speaker.

TABLE 19
Percentage of Respondents Reporting on Role and Function*

Present Primary

Ro1e

Ideal Primary

Direction of Change in Role

After each listed activity, circle the number of the <u>one</u> response in each of Columns A, B and C that best describes:

- Column A, Your present primary role as a psychologist or school psychologist.
- Column B, The ideal primary role (i.e.) as you would like to see the role of the School psychologist.
- Column C, The general change you see (if any) in the emerging role of the school psychologist in the field.

^{*}Respondents were asked to proceed according to the following directions in completing the Role and Function Chart:

| * 2% of the data not account | ed for. |

Data regarding the current and future educational endeavors of the respondents indicated:

- a. One percent were working toward a Master's Degree.
- b. Two percent were working toward a Specialist's Degree.
- c. One percent planned to work toward a Specialist's Degree.
- d. Fifteen percent were working toward a Doctorate Degree while forty-nine percent were not.
- e. Twelve percent planned to work toward the Doctorate Degree while twenty-five percent did not.
- f. Twenty percent stated they were undecided about working toward the Doctorate.
- g. Forty-three percent did not respond to this question.

During the past year forty-two percent of the respondents elected a course for credit at a college or university while 56% did not. (2% of the data was not accounted for).

During the past two years 78% of the members attended a continuing (three or more related meetings) organized professional development program at which they did not serve as a speaker
